ETERNALGY · PRE-SEED · 2026

# The internet is already describing your company. Usually wrongly.

Company Dive audits what the public internet says about a small business — the directories, registers, maps, reviews and AI answers the owner never checks — and sells the owner the fix for **$59**.

A free two-minute preview proves the problem. A twenty-minute automated run delivers the report. Four markets, one pipeline, near-zero marginal cost.

| 4 | 122 | 12 + 6 | <$1.20 | 97%+ |
|---|---|---|---|---|
| markets live: MY · SG · AU · KR | researched checks in 21 country × industry packs | analysis lanes and writing stages per paid run | measured cost of goods per report | gross margin at list price |

01 · THE BLIND SPOT

# Owners cannot see the version of themselves that buyers see.

INSIDE THE BUSINESS

### The story the owner tells

— The website they wrote and approved.

— The Facebook page they curate.

— The pitch they rehearse on every call.

— The licence they renewed last year.

All of it true. Almost none of it what a stranger meets first.

THE INTERNET'S VERSION

### What a buyer actually meets

— A directory still printing the phone number changed in 2021.

— A Maps listing filed under the old legal name.

— A professional registration two days from expiry.

— A 2019 award the owner never displayed.

— Sixty staff reviews nobody has read.

— An AI assistant that names six competitors and not them.

---

The gap between those two columns is the product.

No agency will audit a $500k company for $500 an hour. That is the entire market.

02 · WHY NOW

# Four things changed at once.
# The gap became sellable.

01

### Buyers ask AI first

"Who should I hire for this?" now returns a short list. If the internet describes you wrongly, or not at all, you are not on it — and you never hear about it.

02

### Public records went free

RDAP, certificate transparency, DNS, PageSpeed, Wayback, open professional registers. Evidence that used to need a researcher now needs an HTTP call.

03

### Inference costs cents

A twelve-lane, evidence-first audit now costs less than a coffee. The same work billed by a consultant is $500–5,000 and takes weeks.

04

### The long tail is unserved

Eleven million SMEs across four launch markets. Agencies serve the top one percent. The rest have never had an external audit of any kind.

---

AI made *writing* cheap. It did not make *evidence* cheap. Evidence is the moat — and it is the part everyone else skips.

03 · THE PRODUCT

# Free proof. Paid answers.

Two artefacts, one dataset. The preview is deliberately incomplete; the report is deliberately complete. The same rows feed both, so a number can only match or grow.

THE BAIT

FREE · 2 MIN READ

## A public page that proves real problems exist.

— One finding proven in full: quote, source, consequence.

— Every other finding as a consequence title and urgency tag — never the detail, never the fix.

— Three questions the page says it cannot answer.

— Real strengths, so it reads as an audit and not an attack.

— A guarantee: fewer than ten new findings in the paid report, full refund.

Withholding is the design. The owner finishes it thinking: *"I can see it is real, I cannot see what to do, and doing it myself is a week of work."*

THE PRODUCT

$59 · 20+ MIN RUN

## A print-ready report the owner can act on Monday.

— Six parts: contact, understanding, voice, credibility, assets, speed.

— One cross-part analysis, plus "what a stranger sees in ten minutes".

— A task list sorted by who does the work, with effort and timing.

— Ready-to-use copy: homepage lines, review replies, FAQ, AI-visibility plan.

— Appendix: every finding, every source, every check that found nothing.

A4 HTML + PDF · English and Korean · white-label for agencies.

Pricing and promise as operated today: orders close by email reply and the team starts the run. Self-serve checkout is a use-of-funds item, not a claim.

04 · HOW IT WORKS — THE FREE PATH

# Five steps. One job each.

Every step reads the previous step's saved file. A step never does another step's job, so any step can be re-run, tested or replaced without touching the rest.

01 · RESEARCH

### Gather, never judge

Official-site gate. Own pages first, then country searches, then the 122-check catalog. Maps, LinkedIn and Naver read by our own worker PCs.

`step1_research.json`

02 · TECHNICAL AUDIT

### Deterministic, zero LLM

PageSpeed mobile + desktop. Domain expiry and transfer lock. SPF/DMARC spoofability, TLS. DNS, certificate logs, Wayback, YouTube, Maps reviews.

`assets row`

03 · PEOPLE

### Who is tied to the company

Public people and contact drift: the decision maker, a dead phone field, ex-staff still listed. Company data only — no private numbers.

`people row`

04 · ANALYSE

### The only judge

One LLM call and one recheck produce four lists: findings, contradictions, suggestions, notes. Namesakes dropped. Not found is not a finding.

`step2_*.json`

05 · WRITE

### Never judges

One call writes the summary, the email and the proof line. Plain code checks every sentence against the Step 2 ids, then renders the page itself.

`page + email`

---

**Why the split matters.** Judgement is the only expensive, unreliable part. It happens once, in one place, against saved evidence — so quality is measurable and cost is bounded.

**No kill gates.** A step that fails is recorded and labelled “not run”. The report is still produced, and the gap is named rather than hidden.

Sources: docs/v21.md, docs/v21-step2.md, src/v21/ (steps 1, 1.5, 1.6, 2, 3). Outputs are the actual stored file and row names.

05 · HOW IT WORKS — THE PAID PATH

# Twelve lanes in three waves. Then six writing stages.

The $59 report is the same evidence, pushed through every check the free preview withholds — registers, people, assets, competitors and AI answers. Twenty-plus minutes, fully automated.

| | | | | |
|---|---|---|---|---|
| WAVE 1 OUTSIDE VIEW | MAPS RANK | SEARCH & AI ANSWERS | REGISTERS & CREDIBILITY | NEWS, FORUMS, SOCIAL |
| WAVE 2 IDENTITY | WEBSITE & REACHABILITY | GOVERNMENT REGISTRIES | CROSS-SOURCE MERGE | WHO AI RECOMMENDS INSTEAD |
| WAVE 3 COMPLETION | PEOPLE & CONTACTS | DOMAINS, DNS, CERTIFICATES | BRAND CONSISTENCY | SPEED (MEASURED UP FRONT) |

## Writing, in order — each stage reads what the last one saved

01 RECHECK THE EVIDENCE → 02 CONSULT THE COPY RULES → 03 WRITE TITLES → 04 FULL ANALYSIS → 05 DEPARTMENT PLAN → 06 FINAL CHECK

**Durable by default.** Every lane retries three times and saves before the next starts, so a restart keeps what was found.

**Failure is local.** A lane that dies drops only its own block; the other chapters still ship, labelled.

**Checked twice.** S1 re-reads the evidence before writing; S6 re-reads the written report against it.

Sources: src/divedeeper/v21/run.ts (V21_DEEPER_LANES, V21_DEEPER_WRITING), report-html.ts. Lane code names: H/G/K/N · H/D/C/G · R/A/B + W-speed; S1–S6.

06 · PROOF

# What it finds on real companies. Nothing here is hypothetical.

CONSTRUCTION · JOHOR — 2 DAYS LEFT

### A licence expires in two days

A CIDB G7 registration ending 05/11/2026 — found on a public register the owner does not monitor. Tender eligibility disappears quietly, not loudly.

Source: CIDB register · run 2026-11-03

ACCOUNTING · KUALA LUMPUR — IDENTITY

### Two legal names for one firm

The site footer says YYC Holdings Sdn Bhd; Facebook and a public directory say YYC Advisors Sdn Bhd. A buyer checking the entity finds a different company.

Source: own site vs directory

LOGISTICS · SELANGOR — CONTACT

### Six directories, the wrong number

Directories print 03-3324 4027; the site prints 03-3324 2868. A US carrier with the same name adds a second identity to the pile.

Source: Maps, directories, own site

SOLAR EPC · MALAYSIA — SPOOFABLE

### A domain that can lapse, mail anyone can forge

The domain behind the published email expires 2026-12-04 with no transfer lock. DMARC is p=none, so anyone can send invoices as the company. The LinkedIn phone field is broken.

Source: RDAP, DNS, LinkedIn

---

Each line is a quote and a URL, held in the same row the preview and the report read. The bait is not clever copy. It is the owner's own evidence.

Drawn from the documented validation runs in docs/v21.md and docs/reports/: three market batches of five companies, plus Korean packs and repeat runs on live prospects.

07 · THE ADVANTAGE

# Any model can write an audit. Almost none can gather one.

The model is a commodity and we treat it that way: the cheapest capable model, called once for judgement and once for writing. What cannot be bought off the shelf is the **check catalog**, the **evidence discipline** and the **reader fleet**.

> A competitor can copy the page in a weekend. Copying 122 researched checks across four legal systems takes a research team a year — and then the next country starts.

### 01 The catalog is data, not code

122 checks in 21 country × industry packs. Each names its source, the rule behind it, the exact query and a manual fallback. A new industry is a research task; a new country is a layer, not a rewrite.

### 02 Discipline is enforced in code

Namesakes dropped. Own-site claims filtered out of “the internet says”. Not found is never a finding. Every claim carries a quote and a URL, and the writer is checked sentence by sentence against the ids it cited.

### 03 Reads run on our own machines

Pages, PDFs, Maps, LinkedIn and search results are fetched by worker PCs we already own. Paid indexes are used only where there is no free path. That is why the marginal cost is cents, not dollars.

### 04 One dataset, two products

Preview and report read the same rows, so the paid report can never contradict the free one. The preview's count is what the free check found, never a promise about the total.

### 05 The outcome graph compounds

Every finding, rejection and register hit is stored. In a year that is a benchmark no competitor can buy: how a Johor contractor compares with 400 others, and which checks actually predict a lost tender.

08 · MARKET

# A bottom-up market, not a top-down story.

TAM · FOUR LAUNCH MARKETS

## $1.45B

11M SMEs in Malaysia, Singapore, Australia and South Korea, at $131.50 of annual value per account.

SAM · HAS A SITE, IN OUR INDUSTRIES

## $130M

About 1.0M businesses in accounting, marketing, import/export, interior design and web design.

SOM · THREE YEARS

## $0.6M

4,500 accounts — 0.45% of the serviceable market — at $59 plus a 25% take-up of monitoring.

### Account value

$59 report today; a planned $290/year tier monitors the same footprint and re-runs quarterly.

### Why the wedge is agencies

One accounting or marketing firm brings 50–500 SMEs. White-label, per-client pricing, one invoice.

### Why expansion is cheap

A new country is a country layer plus borrowed industry packs. No new pipeline, no new UI, no new billing.

Bottom-up estimate, rounded. SME counts from DOSM, SME Corp Malaysia, SingStat/MTI, ABS and KOSME; industry mix and monitoring take-up are internal assumptions to be re-verified before close. "Value per account" = $59 + 25% × $290.

09 · UNIT ECONOMICS

# A $59 product with software margins.

| COST OF ONE PAID REPORT | MEASURED |
|---|---|
| Search credits, 30–60 calls | $0.15–0.50 |
| LLM, 3–4 calls | $0.02–0.10 |
| People index, ~15 calls | $0.11–0.55 |
| Infra and storage | <$0.10 |
| Page reads on our own workers | $0.00 |
| **Total cost of goods** | **$0.40–1.20** |

Every call is metered and priced in code. These ranges come from that meter, not from a spreadsheet someone typed once.

Sources: src/cost.ts price table (Tavily $0.008/credit, Brave $0.005/call, Exa $0.007/search, DeepSeek via Vectide); docs/v21-people-step-plan.md cost envelope. Payment fee assumed 5%.

**$59**
price of the full report

**97–99%**
gross margin before payment fees

**<$15**
target CAC: automated Maps → contact → email

**~$40**
contribution on the first order, after fees and CAC

THE HONEST COST TODAY

Checkout is manual, so a sale costs roughly an hour of ops. That is the bottleneck this round removes — not the compute.

10 · DISTRIBUTION

# The outreach machine is already running.

This is not a channel plan. It is the code that fills the queue, enriches the contact and sends the preview while the owner is still deciding whether the problem is real.

### 01 · SWEEP

Every taman in every district is queued for a Maps scan. The lead list fills itself from geography, not from bought databases.

### 02 · ENRICH

Contact research finds the decision maker and a reachable phone or email, and records what it could not verify.

### 03 · PROVE

The free preview runs automatically and lands as a noindex link with the company's own numbers in the subject line.

### 04 · CLOSE

Reply to buy; the guarantee removes the risk. Stripe replaces the reply in the next ninety days.

### 05 · EXPAND

Monitoring subscription, agency white-label, then the next country — same machine, new data.

---

RUNNING TODAY

AUTOSCAN — MAPS SWEEP BY DISTRICT

AUTOCONTACT — PEOPLE AND CONTACT RESEARCH

AUTOQUEUE — HOURLY THROUGHPUT HEALTH

ADS-LEADS — LANDING-PAGE CAPTURE

SMARTLEAD — OUTBOUND SEQUENCES

Sources: worker/ (gmap.mjs, ads.mjs), src/v21/ autoqueue and contact modules. Named modules are running code, not roadmap.

# Everyone sells a dashboard.
# We sell the finding.

| WHO | PRICE | WHAT IT CAN SEE | IDENTITY & REGISTERS | OUTPUT | APAC REACH |
|---|---|---|---|---|---|
| SEO audit tools | $99–999/mo | Your site and backlinks | — | Dashboard you interpret | — |
| AI visibility trackers | $50–500/mo | Prompt mentions | — | Charts | Partial |
| Review platforms | $200–600/mo | Reviews on one profile | — | Review workflow | Partial |
| Local agency audit | $500–5,000 | Whatever they think to check | Sometimes | Deck, then an invoice | Yes |
| **Company Dive** | $59 | Directories, registers, maps, reviews, people, AI answers | Yes | A plan with the copy written | MY · SG · AU · KR, EN + KO |

Competitor pricing from public list prices, rounded and indicative. The comparison is by category, not by vendor.
Company Dive is the only row where the output is a finished task list rather than a tool the owner must still learn.

12 · WHERE WE ARE

# Built. Running. Not yet self-serve.

**4**

markets live: Malaysia, Singapore, Australia, South Korea. Output in English and Korean.

**21**

country × industry packs, holding 122 researched checks — each with a source, a legal reason and a fallback.

**15**

companies in the validation set, run end to end across MY, SG and AU, plus Korean packs and repeat runs on live prospects.

**75.8k**

lines of production TypeScript. 80 test files, 13k lines of tests. Every external call metered and priced.

**12 + 6**

analysis lanes and writing stages per paid run, with durable saves and a final check that re-reads the report.

**2**

products generating end to end: the free public preview and the paid A4 report. The gap between them is billing.

---

WHAT IS NOT BUILT YET — SAID PLAINLY

Self-serve checkout. The monitoring subscription. Two more markets. Sales today are manual, design-partner deals closed by reply; there is no self-serve revenue to show yet. Everything on this slide is engineering that exists, not a pilot that might.

Counts from the repository at this commit: 168 commits, 163 non-test source files, 80 test files. Market and pack counts from src/v21/catalog-data/. Validation set documented in docs/reports/.

# Eighteen months to a self-serve business.

MONTHS 0–3 · REMOVE THE BOTTLENECK

Stripe checkout and automatic run on payment.

Monitoring MVP: quarterly re-run and change alerts.

150 paid reports; three agency pilots signed.

MONTHS 3–9 · WIDEN THE CATALOG

Ten new industry packs in the four live markets.

Agency portal: white-label, per-client pricing, one invoice.

800 cumulative paid reports; 250 subscribers.

MONTHS 9–18 · COMPOUND

3,000 cumulative reports; 800 subscribers.

Two new markets scoped from the same country layer.

Roughly $410k ARR at the exit of the plan.

## Use of $500k

Plan assumes $59 average order and a 25% attach rate on $290/year monitoring. Milestones are internal targets, not guidance.

# The five ways this fails.
# And what is already in the code.

| RISK | ALREADY IN PLACE | WHAT THIS ROUND ADDS |
|---|---|---|
| **Platform access.** LinkedIn and Google can block readers or change terms. | Own worker PCs, an independent search index, ordered fallbacks. No single source is required for a report to exist. | A second reader path per source, plus a legal review of every data route. |
| **Accuracy.** A confident wrong claim about a business is a liability. | Quote and URL only. “Cannot be confirmed” instead of “is false”. Namesakes dropped. Sentence-level checks before publishing. | Spot-check queue, errors-and-omissions cover, a written correction policy. |
| **Willingness to pay.** A $59 one-off is a thin wedge if nobody renews. | Free proof, a refund guarantee, and an agency channel where one buyer pays for many clients. | Monitoring subscription and price tests across the four markets. |
| **Commoditisation.** Anyone can wrap a model and call it an audit. | The value is in registers, directories, namesakes and people — not prose. That is a year of research per country. | Published benchmarks that only our outcome data can produce. |
| **Privacy.** PDPA and its equivalents govern personal data. | Company data only; no private mobile numbers; redaction rules enforced before a page is stored. | A named data-protection owner and an annual audit. |

**What would actually kill it:** if preview-to-paid conversion stays below two percent.

That number is measured weekly, per market and per industry. The guarantee caps the buyer's risk; measuring conversion caps ours.

# $500k pre-seed.
# Eighteen months to prove one number.

THE ROUND

## $500,000

18 months of runway. Two engineering hires, ten new industry packs, self-serve checkout, and the monitoring subscription.

WHAT IT BUYS

— 3,000 paid reports and 800 subscribers.

— Roughly $410k ARR at month 18.

— A measured preview→paid conversion rate per market.

— Two new markets scoped, not guessed.

TEAM

### Operator-led, in-house engineering

Eternalgy is an SME, and the first company it audited was itself. The pipeline was built in-house: 168 commits, 75.8k lines of TypeScript, 80 test files, four markets live. The same team runs the outreach machine and reads the reports it sells.

BEFORE SENDING

Add founder names, roles, photos and the contact address here. The rest of the deck is sourced and ready.

THE ONE LINE

Every SME is already being described. We are the first to show them how — and the first to charge $59 for the answer.

APPENDIX · THE PIPELINE ON ONE PAGE

# Every step, its job, and what it leaves behind.

| STEP | JOB | JUDGES? | LEAVES BEHIND |
|---|---|---|---|
| 1 · Research | Coverage: own site, country searches, catalog probes, Maps and LinkedIn | No | `step1_research.json` |
| 1.5 · Technical audit | Speed, domain, DNS, TLS, certificate logs, Wayback, YouTube, reviews | No LLM | `assets row` |
| 1.6 · People | Who is publicly tied to the company; contact drift | Extract only | `people row` |
| 2 · Analyse | Four lists; drop namesakes; apply “not found” rules | 1 call + recheck | `step2_*.json` |
| 3 · Write | Summary, email, proof line; code validates every sentence | 1 call | `page + email` |
| Paid run | 12 lanes in three waves, then six writing stages | Per lane | `A4 report` |

## The rules that make the output trustworthy

NOT FOUND IS NOT A FINDING · DROP THE NAMESAKE · THE CLIENT'S OWN SITE IS NOT “THE INTERNET” · EVERY CLAIM HAS A QUOTE AND A URL · EVERY NUMBER TRACES TO A CITED ROW · NO KILL GATES — LABEL WHAT DID NOT RUN

Company Dive · Eternalgy · 2026 · Confidential. Built from docs/v21.md, docs/v21-step2.md, docs/divedeeper-modular-design.md, docs/preview-writing-plan.md, src/v21/, src/divedeeper/ and src/cost.ts at commit d0a9260.
